Precision Cutting Tools

Edizione 1601

Hartner GmbH · Casella postale 10 04 27 · D-72425 Albstadt · Tele.: +49 74 31 125-0 · Telefax: +49 74 31 125-21 547 · www.hartner.de

Descrizione

Tipo	Applicazioni	Angolo di spoglia superiore	Angolo di affilatura	Affilatura	
N	per materiali a normale truciolabilità (es. acciaio, ghisa acciaiosa, ghisa grigia)	20°-30°	118°	Spoglia sul cono tagliente Affilatura normale	Punte in acciaio HSS
H	per materiali duri a truciolo corto (es. ottone, bronzo, elektron)	12°-16°	118°	Spoglia sul cono tagliente Affilatura normale	
W	per materiali teneri a truciolo lungo (es. leghe di Al, rame)	35°-40°	130°	Spoglia sul cono tagliente Affilatura normale	
FN	per materiali a normale truciolabilità per fori profondi	35°	130°	Spoglia sul cono tagliente Affilatura normale	
FN 500	per materiali aggressivi a truciolo lungo (es. acciai altamente legati, da bonifica e da cementazione)	20°-30°	130°	Spoglia sul cono tagliente Affilatura normale	
FU 500 FU 500 DZ	per uso universale (es. acciai legati e non legati fino a 800 N/mm^2) DZ = attacco cilindrico passante	35°	118°	2 piani Affilatura speciale	
FW	per materiali teneri a truciolo lungo per fori profondi	35°-40°	130°	Spoglia sul cono tagliente Affilatura normale	
S	per materiali a difficile truciolabilità (es. acciai inossidabili e resistenti al calore)	35°	130°	Spoglia sul cono tagliente Affilatura normale	
IS	per acciai aggressivi, inox, resistenti agli acidi e al calore)	40°	130°	Spoglia sul cono tagliente Affilatura normale	
V	per materiali a difficile truciolabilità (es. acciai per molle)	20°-30°	130°	Spoglia sul cono tagliente Affilatura normale	
TS 3 G	per fori precisi dal pieno	28°	150°	Affilatura speciale	Punte in metallo duro
TS 80 U	per uso universale (es. ghisa grigia e acciai fino a 1000 N/mm^2)	20°-30°	140°	Spoglia sul cono tagliente Speciale riuzione tipo U	
TS 100 U	per acciai fino a ca. 1000 N/mm^2, per uso universale	25°-35°	140°	Affilatura su piani	
TS 150 GG	per ghise a truciolo corto, Alluminio e lghe di Al con alto tenore in Si	0° (taglienti diritti)	120°	Affilatura su piani Speciale riuzione tipo GG	
TS 100 R	per nuove ghise GGV e ADI, ghisa sferoidale/ghisa malleabile	30°	–	Affilatura radiale	
TS 100 T	per fori profondi in acciaio e ghisa	30°	135°	Spoglia sul cono tagliente	
TS 100 INOX	per acciai inossidabili	30°	140°	Affilatura su piani	
TS 100 H	per acciai altamente legati e temprati, così come leghe speciali	30°	140°	Spoglia sul cono tagliente	
TS 100 EG	Utensili sbavatori				Sbavatori
TS 100 VR	Sbavatori a 90° ad avanzamento ed estrazione				
TLB E80	Punte a cannone ad 1 tagliente con testa in MD				Punte a cannone
TLB E100	Punte a cannone ad 1 tagliente in MD integrale				
TLB E800	Punte a cannone ad 1 tagliente con placchette intercambiabili				
TLB Z80	Punte a cannone a 2 taglienti con testa in MD				

Codice ISO

P	acciaio, acciaio legato in alta percentuale
M	acciaio inossidabile
K	ghisa grigia, ghisa sferoidale e ghisa malleabile
N	alluminio ed altri metalli non ferrosi
S	leghe speciali, superleghe e leghe di titanio
H	acciaio temprato e ghisa temprata

Nelle pagine successive, contenenti programmai trovate per ciascun utensile consigli sull'idoneità in base ai seguenti gruppi di impiego:
- ● Idoneità ottima
- ○ Idoneità limitata

● Idoneità ottima
○ Idoneità limitata

HARTNER

Indicazione importanti

Condizioni di fornitura generali
Gli articoli forniti sono soggetti alle nostre condizioni di vendita, disponibili su richiesta.

Quando si ordinano utensili speciali, la quantità ordinata può variare in più o in meno di ca. il 10%, come minimo comunque di 2 pezzi. Sarà fatturata la quantità consegnata.

Condizioni di fornitura per piccoli quantitativi
Ci riserviamo di applicare una maggiorazione di prezzo nel caso di ordini con valore netto inferiore a Euro 100,00.

Gruppi di utensili	Norma	Unità di confezionamento
Punte elicoidali con codolo cilindrico in acciaio super rapido	DIN 338 DIN 1897 e simile norma di fabbrica	≤ Ø 7,50 mm in confezione di 10 pezzi > Ø 7,50 ... Ø 10,60 mm in confezione di 5 pezzi > Ø 10,60 mm in confezione singola
	DIN 339 DIN 340 e simile norma di fabbrica	≤ Ø 6,70 mm in confezione di 10 pezzi > Ø 6,70 ... Ø 10,60 mm in confezione di 5 pezzi > Ø 10,60 mm in confezione singola
	DIN 1869	≤ Ø 7,50 mm in confezione di 10 pezzi > Ø 7,50 ... Ø 10,60 mm in confezione di 5 pezzi > Ø 10,60 mm in confezione singola
Punte elicoidali con codolo conico Morse in acciaio super rapido	tutte le norme DIN e le norme di fabbrica	tutte le misure in confezione singola
Punte elicoidali in metallo duro ed utensili con riporti in MD	tutte le norme DIN e le norme di fabbrica	tutte le misure in confezione singola
Micropunte	DIN 1899	tutte le misure in confezione di 10 pezzi
Punte a centrare	DIN 333 forma A, forma R	≤ Ø 4,00 mm in confezione di 10 pezzi > Ø 4,00 mm in confezione singola
	DIN 333 forma B	≤ Ø 2,50 mm in confezione di 10 pezzi > Ø 2,50 mm in confezione singola

HARTNER
SISTEMI DI DISTRIBUZIONE DI UTENSILI

I sistemi Hartner di distribuzione di utensili TM 326, TM 426 e TM 526 ottimizzano il vostro magazzino e la vostra gestione degli utensili. Ottenete maggiore sicurezza sul vostro stock di utensili e otterrete più trasparenza per la loro gestione!

TM 326

Sistema modulare di distribuzione di utensili

TM 426

Il sistema a spirale per lo stoccaggio di grandi quantità di utensili di piccole dimensioni

TM 526

Il sistema a cassetti con il 100% di controllo sul prelievo degli utensili

HARTNER

Precision Cutting Tools

MODERNI SISTEMI DI DISTRIBUZIONE DEGLI UTENSILI

Automatizzazione dei processi di acquisto

Creazione di report

Disponibilità di dati per la loro elaborazione

Scambio di dati

HARTNER

Precision Cutting Tools

AUMENTO DELLE PRESTAZIONI

ATTRAVERSO L'OTTIMIZZAZIONE DEI PROCESSI DI GESTIONE

"I sistemi di distribuzione di utensili Hartner permettono l'aumento dell'efficienza economica e del lavoro in imprese di ogni dimensione."

I NOSTRI CLIENTI CI CONFERMANO:

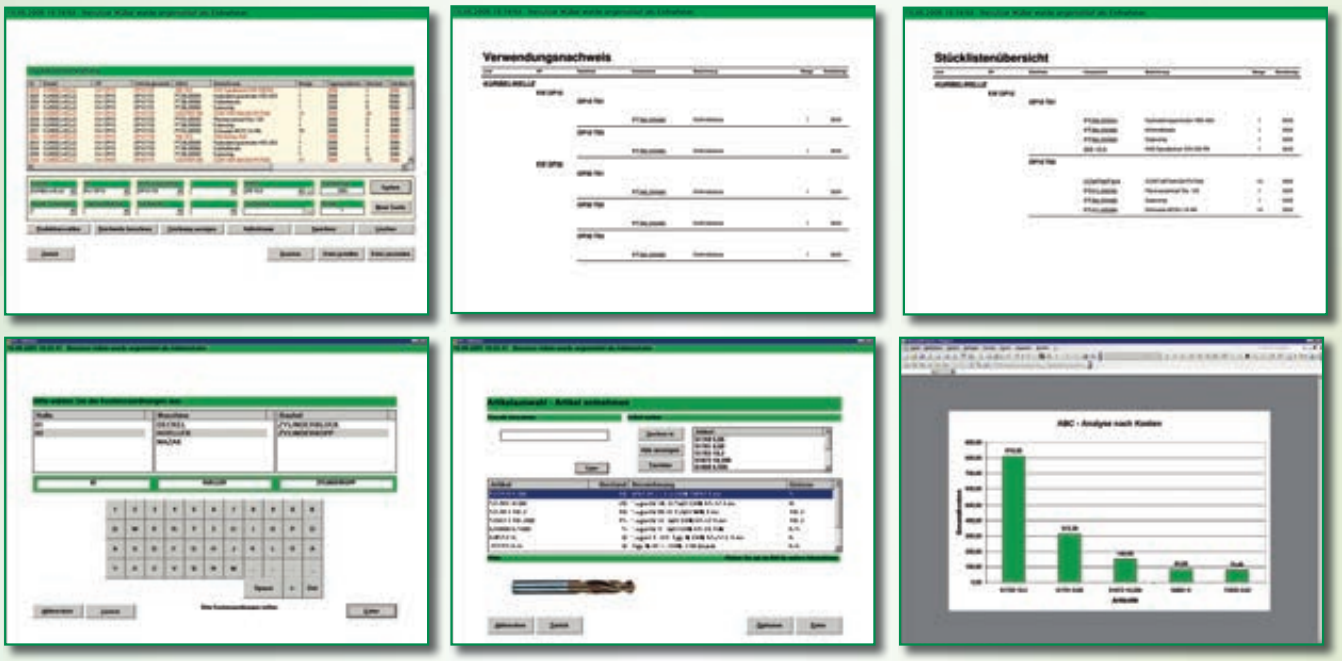
10 % in **meno di costo utensili**

1 ora in **meno di gestione/amministrazione** al giorno

14 % in **meno di fermi macchina**

24 ore di **gestione controllata della distribuzione degli utensili**

INTELLIGENZA INTEGRATA:
IL SOFTWARE PER IL TOOL MANAGEMENT



MODULO ENTRATA MERCI
FORNITORI SOTTO CONTROLLO

MODULO DI GESTIONE ORDINI
PIANIFICATO DALLA A-Z

MODULO DELLO STOCCAGGIO CON GESTIONE DELLA RIAFFILATURA
TUTTI I DATI A PORTATA DI MANO

MODULO DEL RILEVAMENTO DELL'USURA
EFFICIENZA DELL'UTENSILE SOTTO CONTROLLO

DATABASE DEI PRODOTTI
IL CUORE DEL SOFTWARE PER IL TOOL MANAGEMENT

MODULO DEI COMPONENTI DEGLI ARTICOLI
CHIAREZZA E FACILITÀ DI INDIVIDUAZIONE

MODULO PER IL CONTROLLO DEI FERMI MACCHINA
PREVENIRE I FERMI MACCHINA

MODULO DI GESTIONE DEGLI STRUMENTI DI MISURA
CONOSCERE TUTTO CIÒ CHE ACCADE

HARTNER

Precision Cutting Tools

PUNTE ELICOIDALI CON CODOLO CILINDRICO

in HSS, HSS-E, HSS-E-PM, metallo duro
lucide e ricoperte

VHM | T | TS 100 U | 3xD | DIN 6537 K | 140° | m7 | R | HE

Assott. del nocc. ≥ Ø 3,000 • affilatura su piani • forma dei taglienti principali diritta • geometria dei taglienti ottimizzata

acciai da costruzione e da cementazione • acciai automatici, acciai da bonifica • acciai (legati/non legati) fino a 1200 N/mm² • ghise • bronzo/ottone • leghe di alluminio con elevato contenuto di silicio

$t_{max} = l_2 - 1{,}5 \times d_1$

Punte TS con canali di lubrificazione

Articolo nr. 89423

P	M	K	N	S	H
●				●	○

VHM | TS 100 H | 3xD | DIN 6537 K | 140° | m7 | R | HA

Assott. del nocc. ≥ Ø 3,000 • spoglia sul cono tagliente • il tagliente principale è leggermente concavo • geometria dei taglienti ottimizzata

per acciai legati e altamente legati fino a 1400 N/mm² • Inconel, Hastelloy, Monel • titanio e leghe di titanio

Articolo nr. 89424

Punte TS con canali di lubrificazione

Articolo nr. 89425

P	M	K	N	S	H
●				●	○

VHM | TS 100 H | 5xD | DIN 6537 L | 140° | m7 | R | HA

Assott. del nocc. ≥ Ø 3,000 • spoglia sul cono tagliente • il tagliente principale è leggermente concavo • geometria dei taglienti ottimizzata

per acciai legati e altamente legati fino a 1400 N/mm² • Inconel, Hastelloy, Monel • titanio e leghe di titanio

VHM | F | TS 100 R | 5xD | DIN 6537 L | m7 | R | HA

Assott. del nocc. ≥ Ø 3,000 • affilatura raggiata brevettata • tagliente dritto (con la correzione del labbro)
ghisa verimicolare GGV e ADI, CDI • ghisa grigia, ghisa malleabile, ghisa sferoidale

$t_{max} = l_2 - 1{,}5 \times d_1$

HARTNER

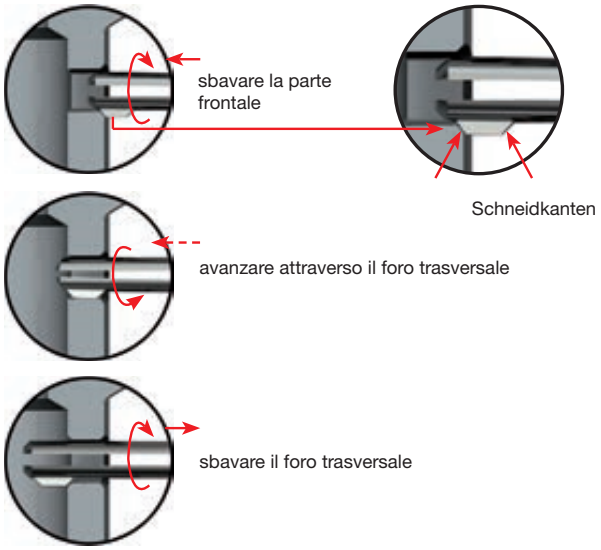
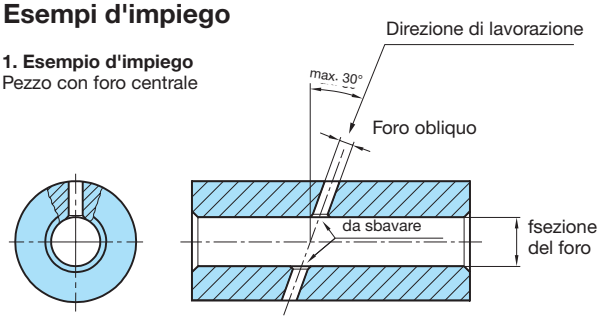
Forchetta per sbavare in MD TS 100 EG

La lavorazione



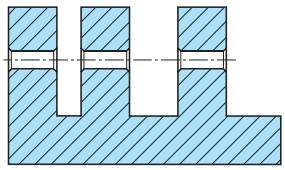
Esempi d'impiego

1. Esempio d'impiego
Pezzo con foro centrale



Con pezzi da lavorare con fori trasversali tenete presente che:
- il diametro del foro trasversale deve essere max. 35% del diametro del foro centrale
- il diametro del foro centrale deve essere 40% più grande della lunghezza tagliente l_4

2. Esempio d'impiego
Pezzo con foro interrotto più volte



Passo per passo:
La sbavatura meccanica interna ed esterna con la forchetta TS 100 EG è una semplice ed economica alternativa all'attuale laboriosa operazione manuale. Con un unico utensile si eseguono tutte le operazioni di lavoro.

Ø-misura (mm)	v_c m/min	fu (mm)
< Ø 4	8 - 10	0,1 - 0,2
Ø 4 - < Ø 6	10 - 14	0,1 - 0,2
6 - Ø 8	14 - 20	0,1 - 0,2

Utilizzo universale:
Con la nuova forchetta per sbavare in MD integrale si possono sbavare pezzi con fori obliqui e con fori interrotti più volte.
Il risultato è in ogni caso la perfetta sbavatura interna ed esterna.

Attenzione:
I valori di taglio sono solo indicativi. Possono essere aumentati o diminuiti a seconda delle condizioni di lavoro.

Punte a cannone ad 1 tagliente E 100

Adatte per quasi tutti i materiali, fornibili da Ø 0,9 a 12,0 mm, lunghezza elica max. 500* mm

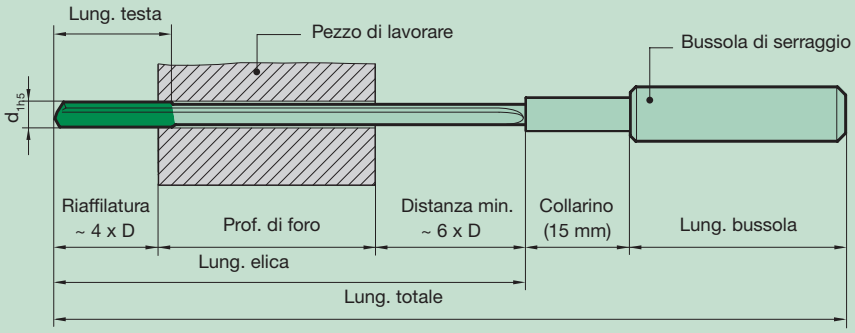
* dipende dal Ø

Affinchè la punta a cannone in MD integrale E 100 sia progettata e costruita per il Vostro specifico impiego,
Vi preghiamo di voler compilare il modulo „richiesta“.

Per una serie di materiali da lavorare è necessaria una ricopertura, perchè la funzionalità della punta a cannone lucida non può essere garantita.
Definizione delle ricoperture, vedere consigli per l'impiego nella parte tecnica.

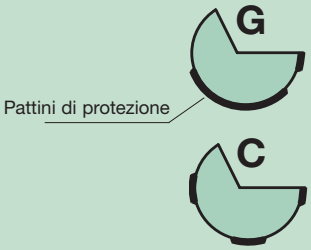
S TiN A TiAlN C TiCN F FIRE Y TiAlSiN A AlTiN a AlTiN nano

Misure necessarie per calcolo delle lunghezze per macchine utensili convenzionali



Forme taglienti

(Posizione del bordo di protezione.
Possibilità di fornire forme speciali)



Adatta per tutti i materiali, con strette tolleranze del foro

Adatta per materiali di difficile truciolabilità, per esempio acciai legati in alta percentuale.

Affilature standard

(Possibilità di fornire affilature speciali)

Punte a cannone ad 1 tagliente saldo-brasate

Hartner è naturalmente in grado di produrre qualsiasi tipo di punta a cannone saldo-brasata, lucida o ricoperta, su richiesta del cliente. Per esecuzioni speciali occorre un determinato lasso di tempo. Offriamo termini di consegna brevi, max. 3 settimane, per le misure sottosegnate.

Ø nom. mm	in progr. mm	Forma tagliente	Lung. totale
2,00...13,90	0,1	G	≤ 7,5 mm Ø 650 max
4,00...13,90	0,1	C	> 7,5 mm Ø 1200 max
14,00...22,00	0,5	G	1200 max
14,00...22,00	0,5	C	

Prezzi a richiesta

Materiale tagliente: metallo duro

Tratt. di superficie: ○

Lung. standard per le teste mm

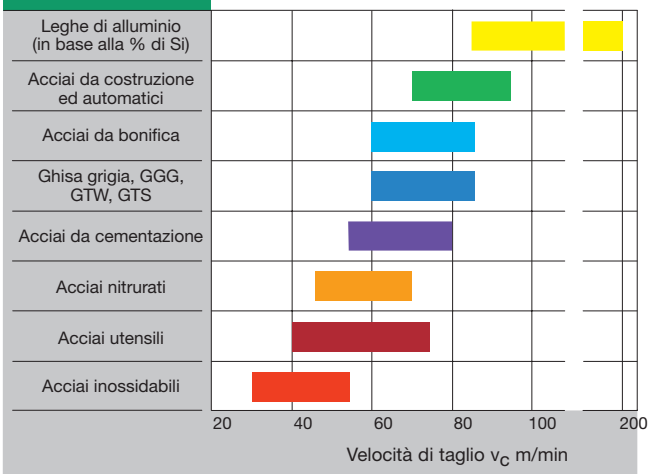
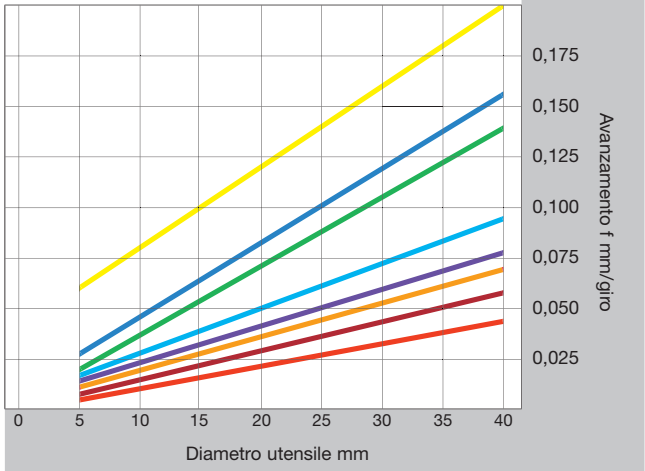
Lunghezza elica: min. 20 x D

Parametri di taglio

Valori indicativi per velocità di taglio

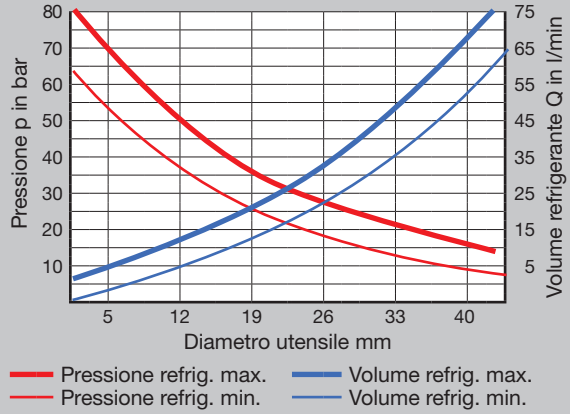


Valori indicativi per avanzamento



Valori refrigerante E 80

(Valori indicativi per emulsione)



in esecuzione ricoperta TiN con scanalatura rompitruciolo per acciai a truciolo lungo

in esecuzione ricoperta TiCN senza scanalatura rompitruciolo per acciai legati e non legati

Punte a cannone a 2 tagl. testa MD Z 80

Adatte per ghisa, alluminio e metalli non ferrosi a truciolo corto, fornibili dal Ø 6,0 - 27,0 mm, lunghezza totale max. 1000 mm

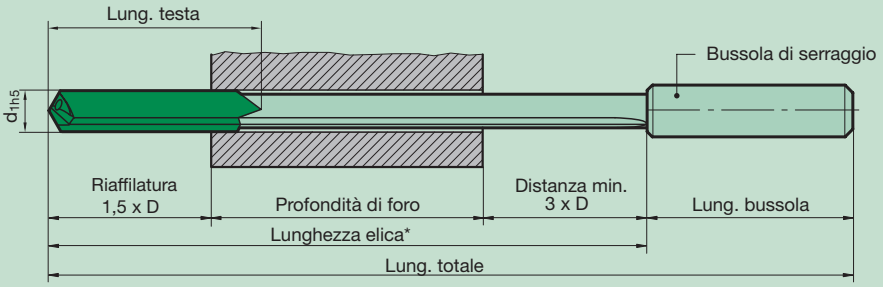
Affinchè la Z 80 sia progettata e costruita per il Vostro specifico impiego,
Vi preghiamo di voler compilare il modulo „richiesta“.

F FIRE **a AlTiN nano**
Per una serie di materiali da lavorare è necessaria una ricopertura, perchè la funzionalità della punta a cannone lucida non può essere garantita.

Principale vantaggio della punta a cannone a 2 taglienti rispetto a quella ad 1 tagliente è l'avanzamento sensibilmente superiore con il quale si può lavorare per produrre fori. Esso deriva dalla costruzione della punta a cannone con due taglienti e due scanalature. Quindi si possono produrre fori più velocemente. In ogni caso questo aumento della velocità di lavorazione è legato ad una diminuita precisione del foro. Anche questa è una diretta conseguenza della costruzione della punta con due taglienti. Poichè c'è un tagliente dalla parte opposta, l'effetto di spianamento e la guida sono minori rispetto a quelli di una punta a cannone con un tagliente. Per profondità di foro ≤ 10 x D consigliamo la punta TS 150 GG, disponibile a magazzeno e, con queste profondità di foro, più conveniente di una punta a cannone. Inoltre, forando con una TS 150 GG, in molti casi si può fare a meno del foro pilota.

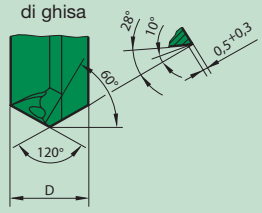
Misure necessarie per calcolo delle lunghezze per macchine utensili convenzionali

***max. lunghezza elica per utensile 40 x D, per profondità di foro superiori, impiegare due utensili (p. es. Ø 10 x 450 e Ø 9,95 x 850 mm).**

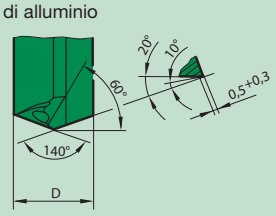


Affilature standard
(Possibilità di fornire affilature speciali)

Affilatura G per lavorazione di ghisa

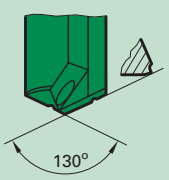


Affilatura A per lavorazione di alluminio



Affilature speciali per esempio:

alluminio



ghisa

Abbiamo a magazzino le bussole del programma qui raffigurato, esso rappresenta però solo una scelta. Naturalmente noi produciamo anche bussole di massima precisione a disegno del cliente. Attenzione! Per E 100 sono necessarie bussole con perno di allineamento. Informazioni a richiesta.

Breve introduzione al tema punte a cannone

Nella tecnica di truciolatura da una profondità di foro di 10 x D e superiore, si parla della così detta punta a cannone, anche se, logicamente, con punte a cannone si possono produrre fori più corti. Si approfitta così dei positivi fenomeni collaterali nei fori, come buona finitura di superficie, minimo scostamento di diametro e rettilineità ottimizzata.

Procedimento per impiego di tutte le punte a cannone su macchine utensili convenzionali:

- Produzione di un foro pilota (tolleranza H8). Entrare con un numero di giri di ca. 200 giri/min, avanzamento ca. 500 mm/min
- Regolazione della pressione del lubrificante e del no. di giri
- Foratura in continuo sull'intera lunghezza, senza scaricare. Impiegando punte a cannone con un grosso rapporto lunghezza-diametro (p. es. E 100 da lunghezza elica 160 mm), consigliamo di lavorare fino ad una profondità di foro di ca. 25 mm con parametri di taglio ridotti (ca. 75% della velocità di taglio ottimale).
- spegnimento dell'adduzione refrigerante al raggiungimento della profondità di foro voluta
- Corsa di ritorno rapida con mandrino fermo.

Raffreddamento ad alta pressione - oggi una cosa ormai ovvia

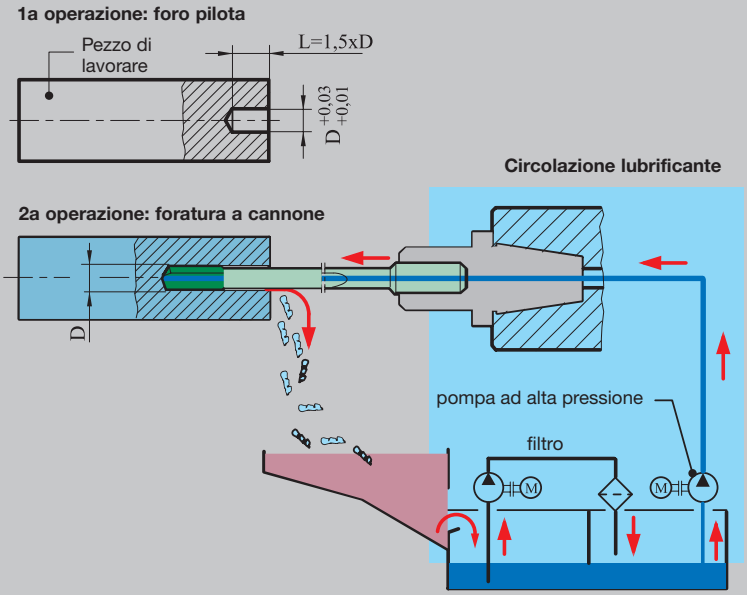
Poichè negli ultimi anni hanno preso piede utensili con fori di refrigerazione interni, il lubrificante passa attraverso tali fori, per arrivare là dove è necessario.
Con questo sviluppo si ottennero anche con punte elicoidali, maschi ecc. sensibili miglioramenti del tempo di impiego ed inferiori rotture degli utensili.
Oggi ogni macchina utensile convenzionale è offerta con refrigerazione interna ad alta pressione, adatta quindi anche per punte a cannone.
In tal modo la quota di punte a cannone impiegate su centri di lavoro, torni ecc. guadagna sempre maggiore importanza. Il procedimento risulta sempre più popolare nella tecnica di truciolatura.

Tutte le punte a cannone devono essere guidate da un preforo.
Le punte a cannone non devono essere mai mosse libere al massimo dei giri nello spazio macchina.

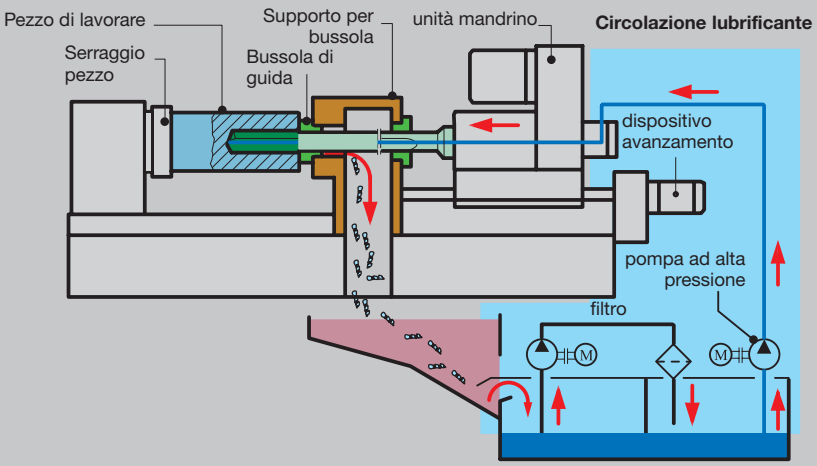
Le punte a cannone non sono un enigma, bensì qualcosa che ognuno può utilizzare tenendo presente precisi presupposti.
Troverete i valori indicativi per l'impiego delle punte a cannone Hartner alle pagine dei rispettivi consigli.

Rappresentazione schematica

Forare con punte a cannone
su macchine utensili convenzionali

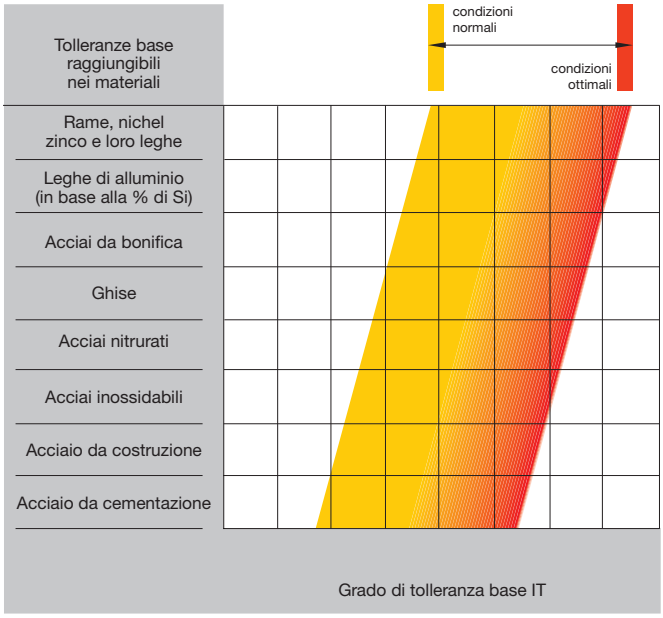


Forare con punte a cannone
su macchine specifiche

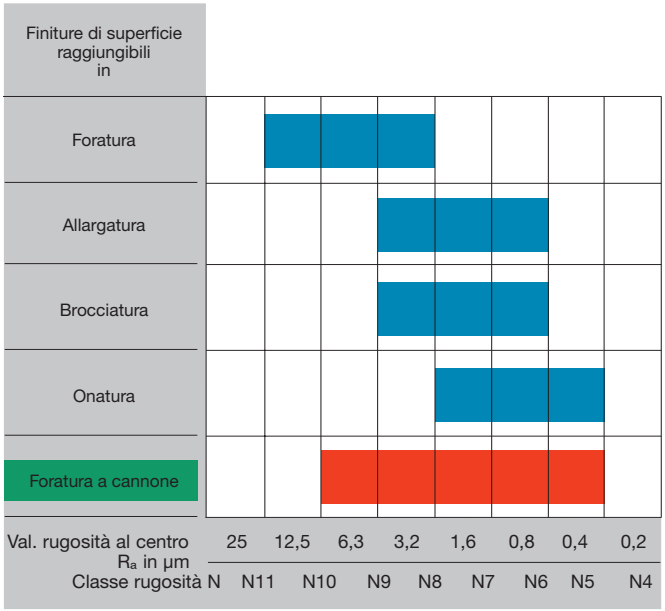


Con punte a cannone ad un tagliente

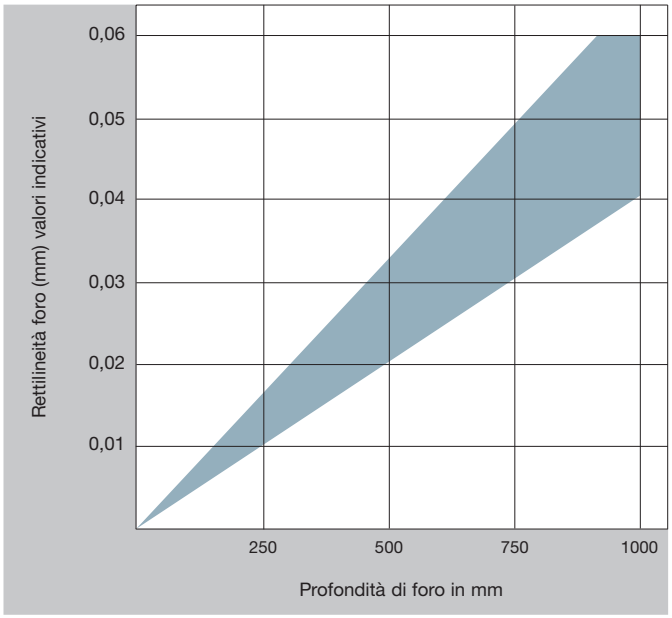
Tolleranze base
Con punte a cannone ad un tagliente si possono raggiungere strette tolleranze di base, perchè le forze taglienti sono assorbite dai pattini di supporto del tagliente e quindi, ad esempio, non accade come per le punte elicoidali che un minimo scostamento di entrambe i taglienti porti subito ad un foro allargato.



Finitura di superficie
Le forze sul tagliente sono assorbite dai pattini di supporto, che lucidano anche la superficie. Perciò la pellicola lubrificante tra i pattini di supporto e la superficie del foro gioca un ruolo importante. Migliore è il lubrificante, superiore risulta la finitura di superficie.



Rettilineità del foro
Dato che la testa di precisione in MD delle punte a cannone ad un tagliente è sempre saldata su un tubo flessibile, l'utensile produce sempre un foro molto diritto, senza essere influenzato da eventuali errori di circolarità. Tuttavia oscillazioni estreme del materiale ed altri fattori possono pregiudicare la rettilineità.



Scostamento dal centro del foro
Se un foro è prodotto con una normale punta elicoidale, la qualità dell'affilatura influenza, tra l'altro, anche lo scostamento dal centro del foro. Insorgono disparità di forze sui taglienti. Nelle punte a cannone ad un tagliente le forze di taglio sono assorbite dai pattini di supporto, ottenendo quindi una buona centratura.

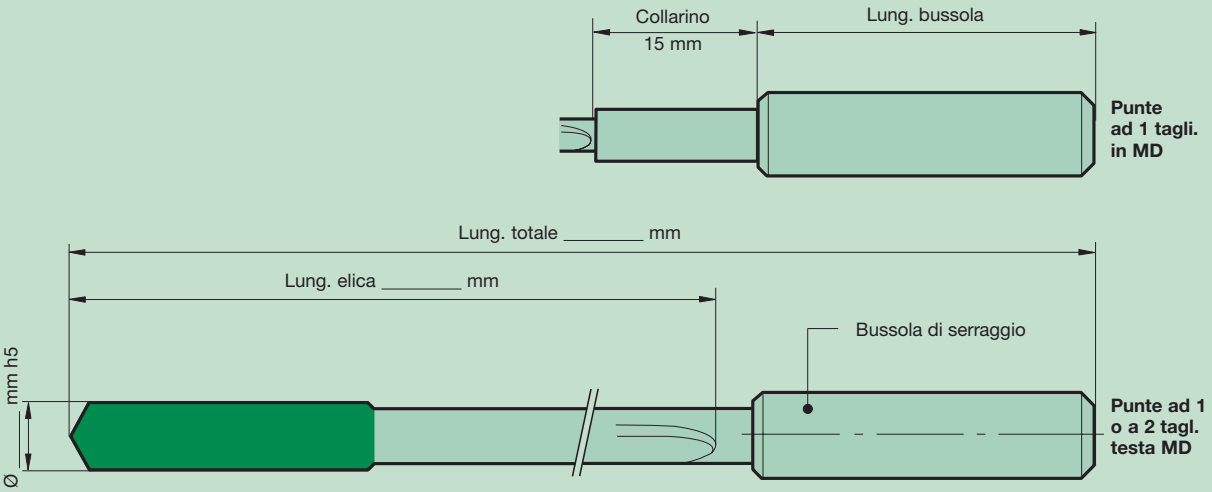
Punte a cannone: ❑ **Punte ad 1 tagli. in MD E 100** ❑ **Punte ad 1 tagl. testa MD E 80** ❑ **Punte a 2 tagl. Z 80**

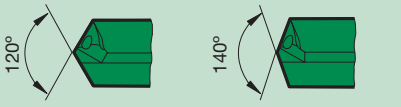
Forma taglienti: _____ **Quantità richiesta:**_____ **pezzi**



Schizzo posizione di foratura

ad 1 tagliente

a 2 taglienti



necessario solo per casi speciali

Bussola di serraggio: ❑ **nessuna** ❑ **nr. ident.:** ❑ **a disegno allegato**

Ricopertura: ❑ **TiN** ❑ **Fire** ❑ **TiCN** ❑ **MolyGlide** ❑ **TiAlN** ❑ **AlTiN** ❑ _____

Pezzo da lavorare: **Prof. di foro:**_____ **Tolleranza del foro:** _____ **Materiale:** _____

Macchina-tipo: ❑ **macc. per punte a cannone** ❑ **macchina utensile convenz.**
❑ **foro pilota** ❑ **bussola di guida**

Lubrorefrigerante: ❑ **olio per punte a cannone** ❑ **emulsione**
Pressione _____ **bar** **Quantità** _____ **l/min**

Pezzo di lav.

Materiale:

Descrizione del particolare:

Numero di pezzi/anno:

Diametro del foro:

Tolleranza di diametro:

Profondità di foro:

Finitura di superficie richiesta:

Spigolo di disturbo alla foratura:
No Si mm

Ulteriori informazioni:

Macchina

Centro di lavoro:

Codolo:

Numero mandrini:

Macchina per punte a cannone:

Codolo:

Numero mandrini:

Lunghezza totale utensile:

Refrigerante:
Emulsione Olio

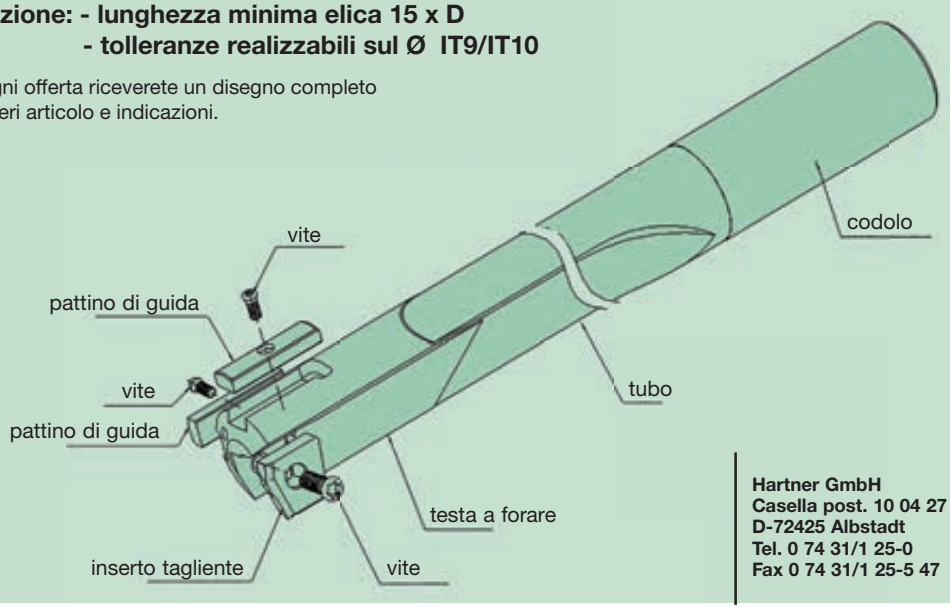
Pressione:
bar

Portata:
l/min

La punta a cannone E 800 per le Vostre applicazioni

Attenzione: - lunghezza minima elica 15 x D
- tolleranze realizzabili sul Ø IT9/IT10

Con ogni offerta riceverete un disegno completo di numeri articolo e indicazioni.



Hartner GmbH

Corpo portaplacchette con attacco cilindrico

Articolo nr. 86624

nichelato • Corpo per placchette. Il corpo con codolo cilindrico ha un'alimentazione di refrigerante interna. Larghe scanalature garantiscono una evacuazione del truciolo ottimale. Sostituzione degli inserti semplice grazie alle viti di arresto. Non è necessario alcun aggiustamento delle placchette. La punta con gli inserti può essere utilizzata nel materiale pieno. Questo utensile non é adatto per finire forature ricavate da fusione oppure per allargare fori preesistenti.i. Comprese viti di serraggio Art.Nr. 86807.

HARTNER

Corpo portaplacchette speciale con attacco cono morse

Articolo nr. 86678

Superficie ≤ 1000 mm lunghezza totale nichelata; > 1000 mm lunghezza totale brunita • Supporto per placchette. Il supporto extra lungo con codolo cilindrico ha un'alimentazione di refrigerante interna. Larghe scanalature garantiscono un trasporto del truciolo ottimale. Sostituzione degli inserti semplice grazie alle viti di arresto. Non è necessario alcun aggiustamento delle placchette. La punta con gli inserti può essere utilizzata in materiale solido. Questo utensile non é adatto per foratura di fori pre-fusi o pre-forati.
Alimentazione refrigerante: radiale (assiale su richiesta).
Comprese viti di serraggio Art.Nr. 86807.

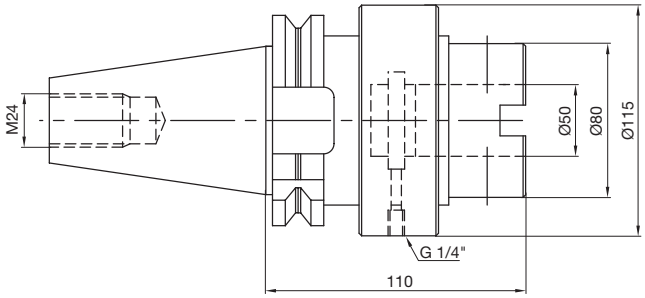
Programma speciale Multiplex sistema modulare Ø 97 mm fino 210 mm

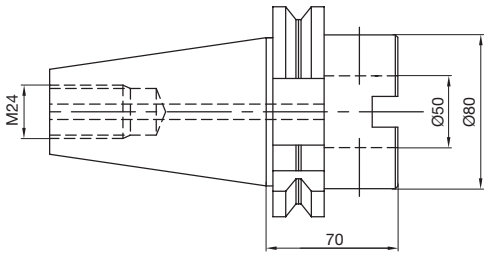
Mandrini

Sono fornibili a richiesta le seguenti esecuzioni:

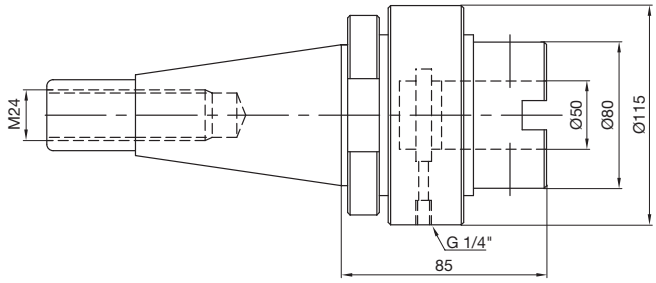
- SK50 DIN 69871 con anello adduttore



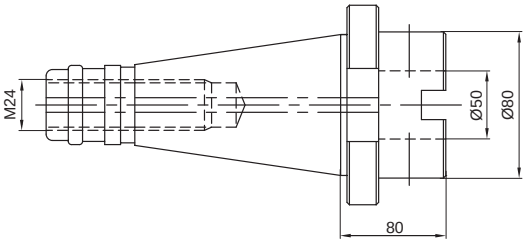
- SK50 DIN 69871 senza anello adduttore



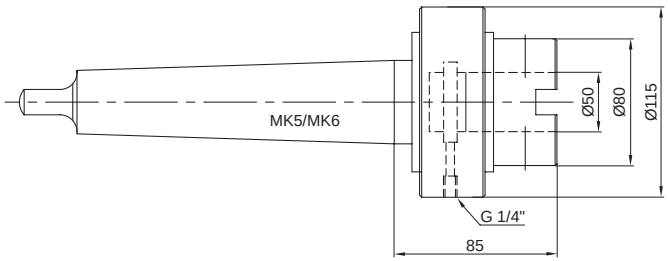
- SK50 DIN 2080 con anello adduttore



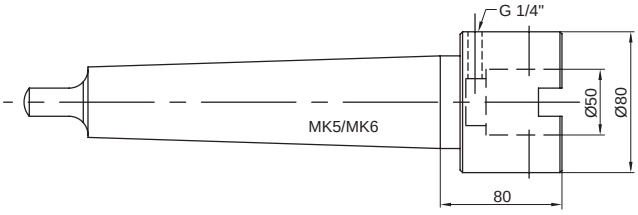
- SK50 DIN 2080 senza anello adduttore



- CM 5/CM 6 con anello adduttore



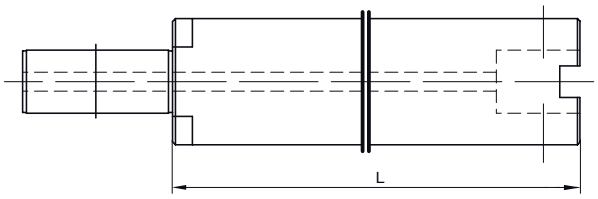
- CM 5/CM 6 senza anello adduttore



Programma speciale Multiplex sistema modulare Ø 97 mm fino 210 mm

Prolunghe per testa foratrice

Prolunghe per testa foratrice
Ø 97 mm - Ø 130 mm
L = 186 mm
L = 300 mm



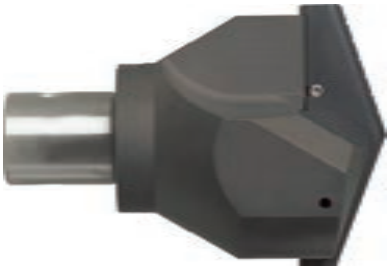
Prolunghe per testa foratrice
Ø 131 mm - Ø 165 mm und Ø 164 mm - Ø 210 mm
L = 204 mm
L = 300 mm
L = 500 mm

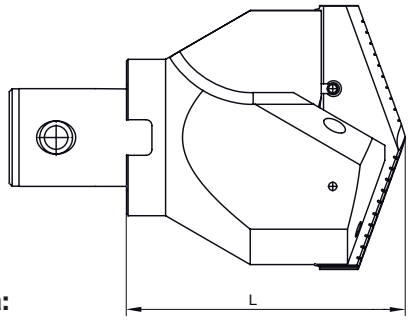
Trascinatore

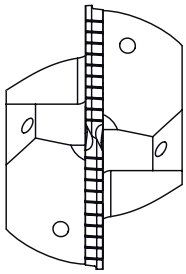
piccolo, per testa foratrice
Ø 97 mm - Ø 130 mm,
larghezza 14 mm

grande, per testa foratrice Ø 131 mm - Ø 165 mm
e Ø 164 mm - Ø 210 mm, larghezza 16 mm

Teste foratrici







Le seguenti grandezze sono fornibili a richiesta:
- Ø 97 mm fino Ø 130 mm, L = 118,5 mm
- Ø 131 mm fino Ø 165 mm, L = 142,5 mm
- Ø 164 mm fino Ø 210 mm, L = 142,5 mm

Inserti intercambiabili

HARTNER

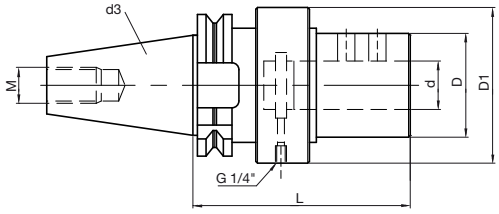
Mandrino di alimentazione del refrigerante per Multiplex

Articolo nr. 86691

B WN SK

Mandrino di alimentazione del refrigerante con attacco SK secondo DIN ISO 7388-1 e attacco per utensili con gambo cilindrico. Per gambi di Ø più piccoli utilizzare le bussole di riduzione.



d3	d mm	D mm	D1 mm	L mm	M	 kg	Codice

HARTNER

Corpo portaplacchette Multiplex-HPC

Articolo nr. 86683

Ni | HPC | 3xD | WN | R | HE

specifico per elevata resistenza all'usura • taglio trasversale della scanalatura ottimizzato • stabilità elevata • viti Art. nr. 86843 comprese • giravite Art. nr. 86842 compreso

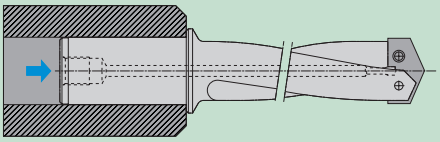
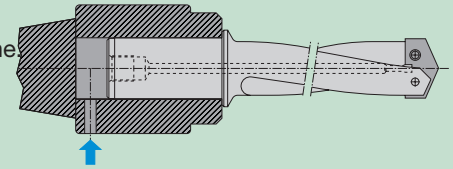
Multiplex – L‘alternativa versatile

Ogni corpo portaplacchetta Multiplex dispone di un canale interno di refrigerazione, che garantisce un’alimentazione ottimale del lubrorefrigerante ai taglienti nella foratura sia orizzontale che verticale e ne prolunga la durata.
Al contempo il refrigerante provvedere anche a uno scarico ottimizzato dei trucioli dal foro.
La refrigerazione avviene in modo differente nelle diverse versioni di codolo:

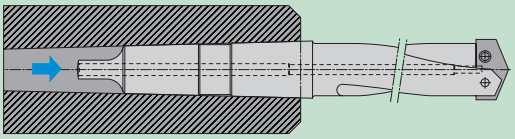
Foro di alimentazione sul lato anteriore del codolo
Per utensili **fissi** e **rotanti**:
Alimentazione assiale del refrigerante attraverso il portautensile.
Per corpi portaplacchetta con codolo cilindrico Ø foro 10 - 102 mm.
Corpo portaplacchetta Art. n. 86612/86622/86624/86730/86740/86750 e corpi extra lunghi



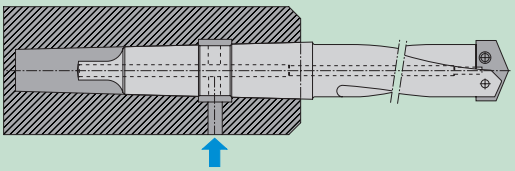
Foro di alimentazione sul lato anteriore del codolo con mandrino di alimentazione. Per utensili **rotanti**:
Alimentazione radiale del refrigerante attraverso il mandrino di alimentazione.
Per corpi portaplacchetta con codolo cilindrico e Ø foro 10 - 102 mm.
Corpo portaplacchetta Art. n. 86612/86622/86624/86730/86740/86750 e corpi extr a lunghi, mandrini SK40/50 int. cil. e MK4/5/6 int. cil.



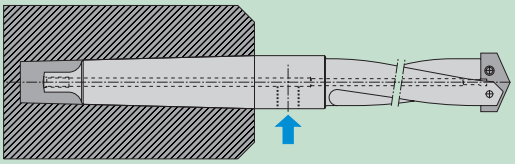
Foro di alimentazione sul dente di trascinamento
Per utensili **fissi** e **rotanti**:
Alimentazione assiale del refrigerante attraverso il portautensile.
Per corpi con codolo conico Morse e
Ø foro 10 - 25 mm.
Corpo portaplacchetta Art. n. 86630/86650



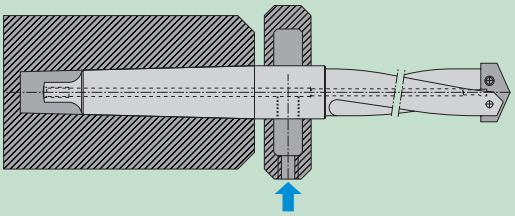
Foro di alimentazione laterale sul cono Morse
Per utensili **rotanti**:
Alimentazione radiale del refrigerante attraverso il portautensile.
Per corpi portaplacchetta con codolo conico Morse e
Ø foro 10 - 25 mm.
Corpi a richiesta



Foro di alimentazione laterale sulla sede della superficie di scorri-mento anulare. Per utensil **rotanti**:
Alimentazione del refrigerante tramite raccordo diretto tubo flessibile/rigido con filettatura R1/4” e R1/2”. Per corpi portaplacchetta con codolo conico Morse e sede per anello alimentatore per Ø foro 25 - 102 mm.
Corpo portaplacchetta Art. n. 86670/86680 e corpi extra lunghi

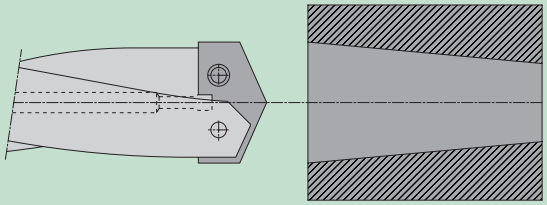


Foro di alimentazione laterale sulla sede della superficie di scorrimento anulare.
Per utensili **rotanti**:
Alimentazione radiale del refrigerante attraverso l’anello alimentatore.
Per corpi portaplacchetta con codolo conico Morse e superficie di scorrimento anulare per Ø foro da 25 mm.
Corpo portaplacchetta Art. n. 86670/86680 e corpi extra lunghi

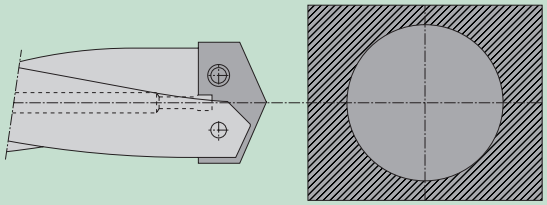


Multiplex – Consigli e trucchi

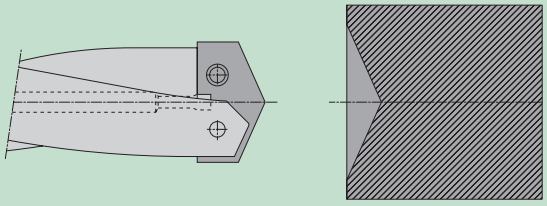
Allargatura di fori
Poiché il sistema Multiplex è guidato principalmente dal tagliente trasversale, non è idoneo per l'allargatura di fori prefusi o preforati. Se il sistema deve comunque essere utilizzato, è necessario ridurre i parametri d'impiego.



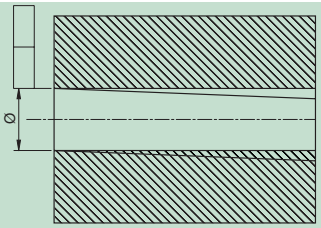
Foratura in sezione interrotta
Il sistema Multiplex non è idoneo per la foratura in sezione interrotta (per es. fori trasversali che sono più grandi del diametro del foro).



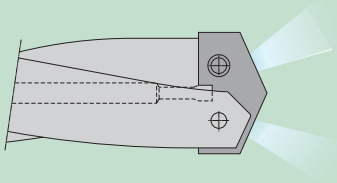
Centraggio del foro
Le placchette di foratura del sistema Multiplex sono assottigliate in punta. Il centraggio è pertanto necessario soltanto a partire da profondità maggiori del foro. Qualora il centraggio sia necessario per motivi tecnici, l'angolo al vertice del centraggio deve essere uguale o maggiore dell'angolo al vertice della placchetta di taglio. Ciò corrisponde a: < d = 25,4 mm = 135°
< d = 66,0 mm = 132°
> d = 66,0 mm = 140°
Per l'alesatura può anche essere usato un corpo portaplacchetta corto (3xD).



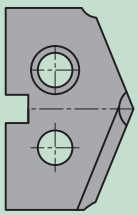
Andamento della punta
L'andamento della punta dipende da diversi fattori.
Come valore indicativo per profondità del foro fino a 7xD può essere assunto un valore di circa 0,1-0,16 mm.
Tuttavia in questo caso dovrebbe sempre essere impiegato il tipo di corpo più corto e quindi più stabile.



Pressione del refrigerante
Il refrigerante nel sistema Multiplex è estremamente importante per lo scarico trucioli. Può essere utilizzato a partire da una pressione di circa 5 bar. In generale vale tuttavia la seguente regola: più refrigerante c'è a disposizione, meglio è. Tramite l'impiego di anelli o mandrini alimentatori, il sistema Multiplex può essere utilizzato anche con il raffreddamento esterno impiegato sulle macchine più vecchie.
L'applicazione prevista può comunque essere discussa in qualunque momento con i nostri tecnici.

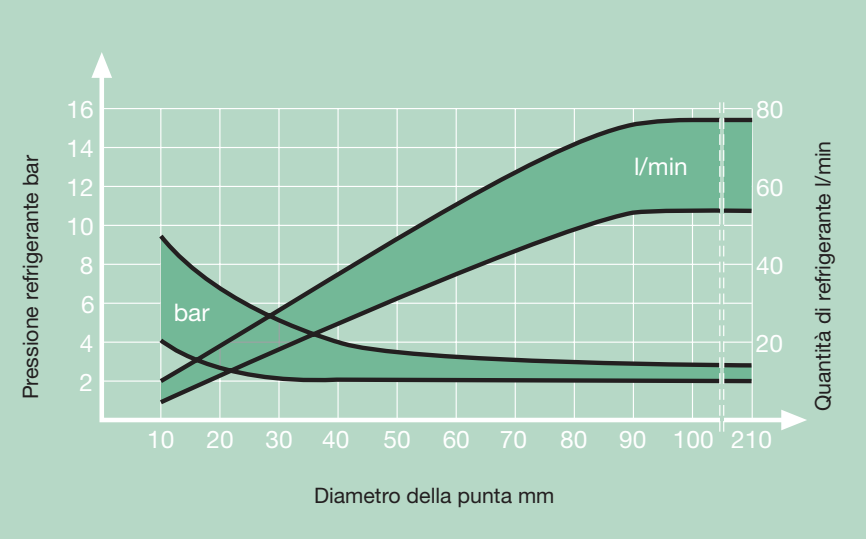


Forte usura dei taglienti
Quando sugli angoli dei taglienti si è formato un gradino, significa che la velocità di taglio è troppo elevata e deve essere ridotta. Misurate il diametro che si è consumato e calcolate nuovamente la velocità di taglio sulla base di questo valore. Sottraete il 10% da questo nuovo numero di giri e immettete il valore nella macchina.



Multiplex – Il gruppo refrigerante

Un gruppo refrigerante efficiente ha un'importanza fondamentale. Qualora la pressione e la quantità del refrigerante non fossero sufficienti, ciò può produrre una superficie di foratura insoddisfacente oppure causare la rottura dell'utensile.
La dimensione delle particelle di solidi nel refrigerante non deve possibilmente superare 50 µm. Per l'impiego degli utensili Multiplex e per placchette intercambiabili sia in acciaio rapido che in metallo duro, raccomandiamo di utilizzare come liquido di refrigerazione un'emulsione per foratura nel rapporto di miscelazione consueto di 1 : 20. Ancora più importanti della composizione dell'emulsione sono la pressione e la quantità del liquido di refrigerazione. Un gruppo refrigerante efficiente è pertanto un presupposto essenziale per un raffreddamento e una lubrificazione soddisfacenti.



Macchina e pezzo in lavorazione

Soltanto la stabilità di macchina, mandrino, serraggio del pezzo e pezzo in lavorazione consentono di impiegare il metallo duro come materiale dei taglienti. Una rigidità insufficiente provoca delle vibrazioni oppure uno stallo della punta nei fori passanti, quando il tagliente trasversale fuoriesce dal pezzo. Le conseguenze possono essere lunghezze di taglio ridotte o rottura della placchetta.

Multiplex – Geometrie speciali

Placchetta sagomata su disegno del cliente (HSS-E/HSS-E-PM o MD).

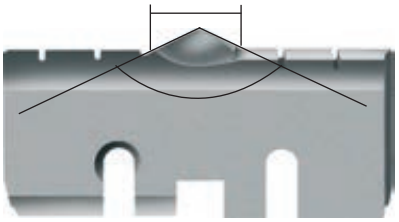
Placchetta NC (HSS-E/HSS-E-PM o MD) con angolatura a 90° o 120° (l'angolo di 90° della punta viene deformato secondo il Ø della placchetta).

Placchetta raggiata (HSS-E/HSS-E-PM o MD).

Placchetta a gradino (HSS-E/PM HSS-E oppure MD).

Geometria alluminio (MD) per la lavorazione di metalli leggeri e materie plastiche (MD).

Ø = 2x larghezza di placchetta



Placchetta a gradino (HSS-E/HSS-E-PM o MD).

Geometria ottone (MD) per la lavorazione dell'ottone e di materiali similari (MD).

Placchetta foro cieco* con punta di centraggio (HSS-E o HSS-E-PM).

Superficie levigata per materie plastiche rinforzate con fibre (MD).

*** Per utilizzo in fori ciechi e placche a modelli tenere presente quanto segue:**

- utilizzare soltanto corpi corti
- preforare con una normale placchetta Multiplex (stesso Ø oppure Ø più piccolo)
- solo in casi limitati adatte per forature dal pieno
- inviare possibilmente disegno del foro da eseguire

Geometrie speciali fornibili a richiesta con i diversi rivestimenti della nostra gamma.
Interpellateci. Tempo di consegna circa 3 settimane.

HARTNER

Multiplex HPC – Tecnologia e vantaggi

Con il sistema di foratura intercambiabile Multiplex HPC Hartner offre corpi portaplacchette e inserti intercambiabili ad alte prestazioni e costi contenuti per fori con Ø da mm 11 a mm 40, i quali garantiscono i seguenti vantaggi:

- **Alta resistenza all'usura**
  Grazie a speciali taglienti microlavorati e applicazioni orientate alla finitura delle superfici gli inserti intercambiabili del sistema di foratura Multiplex HPC sono particolarmente resistenti all'usura. Anche il corpo portaplacchetta Multiplex HPC possiede una elevata resistenza all'usura. Ciò è possibile grazie a un'ottimizzazione del materiale del corpo, al trattamento di ricopertura al nickel e alla maggiorazione delle dimensioni del corpo nelle grandezze con passo mm 0,5 fino a Ø mm 31,99 e con passo mm 1 fino a Ø mm 32. Questo comporta una minore usura al corpo portaplacchetta.

- **Scanalature ottimizzate**
  Grazie ad una ottimizzazione della sezione trasversale delle scanalature il supporto dell Multiplex HPC assicura una ottimale evacuazione del truciolo dal foro anche con grandi profondità di foratura.

- **Perfetta lubrificazione di raffreddamento**
  Una perfetta lubrificazione di raffreddamento è assicurata da condotti di lubrificazione con sezione trasversale massima, in uscita nelle scanalature. In tal modo è possibile un ottimale raffreddamento dei taglienti e un supporto addizionale all'evacuazione del truciolo dal foro.

- **Alta precisione e stabilità della sede dell'inserto**
  L'accurata esecuzione della sede consente il cambio inserto in pochi e semplici passaggi. Grazie all'ottimizzazione del materiale dei corpi portaplcchette del sistema di foratura Multiplex HPC, l'inserto può essere cambiato più frequentemente rispetto ai sistemi convenzionali, prima che il corpo stesso venga danneggiato dall'azione di usura sulla sede dell'inserto. Le viti di serraggio con chiusura a vite garantiscono un sicuro bloccaggio dell'inserto intercambiabile nel supporto anche con macchine soggette ad alti livelli di vibrazioni.

- **Supporti rigidi**
  La ridotta differenza di diametro con la dimensione del corpo non solo diminuisce l'usura. Attraverso una migliore guida dell'utensile nel foro essi aumentano la rigidità del sistema Multiplex HPC. Conseguentemente una maggiore vita utensile così come una migliore superficie del pezzo lavorato.

TS 100 H in MD	MD	TiAlSiN	Micrograna K/P	per acciai temprati e molto duri, leghe speciali

In virtù della possibilità d'impiego universale dei nostri nuovi metalli duri K, i gruppi d'impiego MD vengono ormai definiti soltanto con K (per utensili non ricoperti) o K/P (per utensili ricoperti).

Il materiale tagliente metallo duro

Metallo duro è, come acciaio, un termine molto vago per definire l'intero gruppo, poiché il metallo duro è un composto, che, con la modifica della combinazione di almeno due componenti base, può essere prodotto in infinite varianti con differenti proprietà.

La produzione del metallo duro
I metalli duri sono composti da un materiale duro portante – carburo di Volframio (VC) ed eventualmente altri carburi – e da un componente plastico: il cobalto (Co). Il cobalto funziona, per così dire, come legante, nel quale le particelle di materiale duro si distribuiscono.

Per soddisfare le varie esigenze sul metallo duro, che sorgono a seconda dell'impiego, la Hartner dispone di una scelta di oltre 20 differenti tipi di metallo duro standard. Alcuni sono particolarmente duri, altri hanno una maggiore plasticità, certi sono a grana particolarmente fine, altri, al contrario, a grana più grossa. Inoltre, su richiesta del cliente, si possono sviluppare e produrre tutti i possibili tipi di metallo duro come esecuzione speciale.

Affinchè i prodotti in metallo duro corrispondano sempre alle massime esigenze del cliente, lo stabilimento del metallo duro dispone di un laboratorio ultra moderno, nel quale si effettuano continuamente test sia sul materiale grezzo che sul prodotto finito, per potere garantire e documentare la massima qualità e sicurezza di procedimento, corrispondenti alla certificazione.

Proprietà basilari di metalli duri per forature

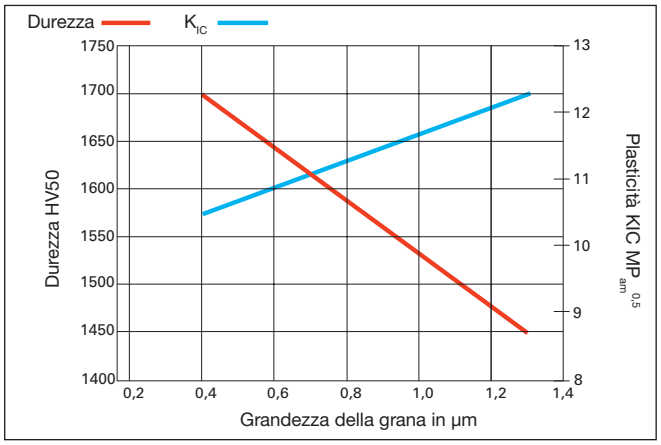
Per forature sono importanti le seguenti proprietà:

Rigidità
La rigidità è la misura della forza occorrente per ottenere una deformazione in un materiale. Nel metallo duro essa è determinata dal contenuto di cobalto. Maggiore è il contenuto di cobalto, minore la rigidità del materiale.

Per esempio, i comuni metalli duri sono mediamente rigidi più del doppio degli acciai. Quindi con punte in metallo duro si producono fori molto più diritti che con punte in acciaio. Questo effetto positivo della rigidità è tuttavia limitato, poiché la deformazione imposta alla punta – ad esempio con scentratura o squilibrio – portano ad un carico enormemente aumentato del materiale. Per questo i materiali più rigidi sono anche i più esposti a rotture.

Durezza
Con durezza si intende la resistenza di un materiale alla penetrazione di un altro. E' chiaro che il materiale dell'utensile debba essere molto più duro di quello del pezzo da lavorare, per evitare l'insorgere di una eccessiva usura.

Per regolare la durezza di un metallo duro esistono molteplici possibilità: da un lato la modifica del contenuto di cobalto, dall'altro la variazione della grandezza della grana del carburo impiegato. Se si aumenta il contenuto di cobalto, lasciando invariata la grandezza della grana, diminuisce la durezza del metallo duro. Al contrario, se si diminuisce la grandezza della grana, lasciando invariato il contenuto di cobalto, la durezza aumenta.



Plasticità
Si definisce plasticità l'opposizione di un materiale all'allargamento di una fessurazione. Un'alta opposizione a fessurazione è il segno di metalli duri "buoni", che presentano un'alta resistenza ai colpi. Purtroppo la durezza e la plasticità sono proprietà antitetiche.
Alto contenuto di cobalto e/o grana grossa del materiale duro sono indicazioni di metalli duri plastici. Un'alta plasticità è necessaria nel processo produttivo là dove insorgano carichi repentini oppure alti carichi di taglio. Alti carichi di taglio insorgono soprattutto là dove esiste un elevato valore di frizione tra utensile e materiale lavorato. Esso è determinato dalla rugosità della superficie dell'utensile e dal comportamento chimico tra superficie dell'utensile e pezzo da lavorare.
Qui bisogna anche sottolineare che plastico non significa automaticamente anche con alta resistenza alla flessione. La proprietà che porta ad una resistenza alla flessione è la resistenza degli spigoli.

Resistenza degli spigoli
La resistenza degli spigoli descrive l'opposizione di uno spigolo alle rotture o di singole grane di materiale duro e di più grosse formazioni di grana. La resistenza alla flessione rappresenta in grossa misura la resistenza degli spigoli. Nella resistenza alla flessione è compresa, accanto alla plasticità anche la grandezza degli intergrani più lunghi nella struttura caricata. In questo modo un'alta plasticità aumenta la resistenza alla flessione, tuttavia gli intergrani più lunghi (= grana più grossa) la fanno diminuire.

Reattività
Anche se attualmente la maggioranza dei metalli duri è utilizzato con una ricopertura, bisogna tenere in considerazione la tendenza alla reazione tra metallo duro e pezzo lavorato. Dato che la ricopertura si usura in fretta sui taglienti, si può avere una reazione tra utensili e pezzo lavorato.

Similarmente alla corrosione profonda con l'ossidazione, un attacco locale mostra conseguenze molto più permanenti che un danno su una grossa superficie. Particolarmente il cobalto reagisce più velocemente dei metalli acciaiosi proprio alle temperature che insorgono sui taglienti. Altri metalli, come, ad esempio, titanio o silicio, reagiscono di preferenza con il carburo di Volframio. Per questi motivi il contenuto di cobalto dell'utensile è interessante per la reattività di quest'ultimo.

Il materiale tagliente metallo duro

Scelta del materiale
Scelta del materiale
E' quindi necessario un accurato bilanciamento delle differenti proprietà per gli specifici casi di impiego. Questo comporta l'offerta di una grande varietà di metalli duri. Per trovare il metallo duro adatto per un determinato lavoro sono stati provati differenti sistemi di classificazione, poi inseriti come norma, che dovrebbero semplificare la scelta. Molto ampio è il sistema delle classi di impiego ISO secondo DIN ISO 513.
Al momento in Germania sono in uso le designazioni a DIN ISO 513. Il nuovo ordinamento è presentato in breve qui di seguito.

Gruppo principale P
Questo gruppo comprende i metalli acciaiosi a truciolo lungo, ad eccezione degli acciai inossidabili ed austenitici, ed è, a seconda del carico di taglio, suddiviso nei gruppi di impiego 01 – 50.

Gruppo principale M
Al gruppo M appartengono acciai inossidabili austenitici, acciai austenitici/ferritici ed acciai fusi. Esso è, a seconda del carico di taglio, suddiviso nei gruppi di impiego 01- 40. Alla Hartner gli utilizzi P ed M si realizzano con metalli duri K ricoperti.

Gruppo principale K
Nel gruppo K sono riunite ghisa grigia in tutte le forme e ghise malleabili. A seconda del carico di taglio si ha la suddivisione nei gruppi di impiego 01 – 40.

Gruppo principale S
"Superleghe" resistenti al calore, basate su ferro, nichel o cobalto nonché leghe di titanio appartengono al gruppo S. Qui, a seconda del carico di taglio, si hanno i gruppi di impiego 01 – 30.

Gruppo principale N
Questo gruppo contiene metalli non ferrosi, specialmente leghe di alluminio e materiali non metallici. E' suddivisa, a seconda del carico di taglio, nei gruppi di impiego 01 – 30.

Gruppo principale H
Questo gruppo comprende la lavorazione di acciai e ghise temprati. I gruppi di impiego, a seconda del carico di taglio, vanno da 01 a 30.

Molti tipi di metallo duro comprono un ampio ambito di questi gruppi principali di truciolatura, particolarmente quando si impiega una ricopertura. Perciò , ad esempio, la maggioranza delle punte ricoperte FIRE del programma Hartner, sono correlate ai gruppi di truciolatura K e P.

Singoli tipi Hartner
La tabella seguente rappresenta i metalli duri fondamentali del programma standard Hartner per utilizzi generali di foratura. Ulteriori tipi sono fornibili su richiesta.

Per oltre l'80% degli impieghi a noi conosciuti, i risultati ottenuti con utensili in DK460UF, combinati con le idonee ricoperture, rispetto ad altri tipi di metallo duro, anche ricoperti, sono imbattibili. Questo e la grande disponibilità a magazzeno di questo materiale semplificano molto la scelta dell'utensile. I nostri tecnici Vi preciseranno volentieri dove sia ragionevole impiegare gli altri tipi di metallo duro.

Tipo	Contenuto di Co [M-%]	Grandezza grana WC [µm]	Durezza [HV]	Classificazione ISO [ISO 513]	Caratteristiche
DK460UF	10	0,5	1620	K20-K40 ricoperto: P, M20-M40, H, S, N25	Tipo per impiego molto vasto, che, prevalentemente ricoperto, si impiega per lavorare acciai, leghe tenere di alluminio, ghise, ma anche superleghe come inconel 718. Questo tipo rappresenta la colonna vertebrale della nostra produzione.
DK255F	8	0,7	1720	K20 ricoperto: P, M, H, S, N20	Questo tipo è consigliato per lavorare materiali temprati, tipi di ghise molto dure e leghe dure di Al-Si. E' possibile la lavorazione a secco. E' preferibile impiegarlo ricoperto.
DK120	6	1,3	1620	K15 ricoperto: N15	Questo tipo è adatto specialmente per l'impiego con ricopertura diamantata.
DK120UF	7	0,5	1850	K05	Tipo a grana ultra fine con massima resistenza all'usura, adatto per macchine assolutamente stabili, preferito per alesatori.
DK400N	10	0,7	1580	K35M ricoperto: P, M, S, N35M	Tipo molto plastico per la lavorazione di metalli resistenti alle alte temperature.

Materiali lavorabili di preferenza	Al, AlSi, acciaio, leghe di speciale	universale	acciai inox, leghe di nickel	ghise, acciai legati, acciai molto resistenti, CFK	acciai universali alto contenuto in C, acciai da bonifica, acciai al Mn, acciai ad elevata resistenza al calore	titanio, alluminio, leghe al nickel, acciai inox
Particolarità	lavorazione a secco, insensibile a carichi d'urto	facilita l'evacuazione del truciolo	basso attrito	largo campo di impiego	bassa tendenza all'adesione	bassa tendenza all'adesione

Superfici

lucide

Utensili in acciaio super rapido od in metallo duro sono forniti senza trattamenti di superficie, ossia lucidi, per le loro proprietà base generalmente buone.

Trattamenti di superficie
Per casi specifici tuttavia, è consigliabile, per aumentare la resistenza all'usura o per diminuire la resistenza allo scorrimento o la formazione di taglienti di riporto, ricorrere ad un trattamento di superficie. I trattamenti elencati di seguito perdono sempre più significato. Generalmente ottenete risultati migliori con le ricoperture dura e tenera.

nitrurazione a vapore

fasi nitrurate

La nitruratura è una possibilità di rendere gli utensili più resistenti all'usura. Consigliabile per la lavorazione di materia-li come ghisa grigia, alluminio con elevato contenuto di Si, materie sintetiche, acciai con alto contenuto di perlite, ecc.. Nitruriamo i nostri utensili con differenti procedimenti, secondo l'impiego.

vaporizzazione

Utensili trattati a vapore offrono a loro volta minore resistenza allo scorrimento. In questo modo si possono convenientemente ridurre saldature a freddo, che insorgono facilmente, per esempio, nella lavorazione di acciai poveri di carbonio. Utensili trattati a vapore sono adatti solo per la lavorazione di materiali ferrosi.

Le ricoperture Hartner

Ricopertura **A** o TiAlN (nitruro di titanio-alluminio)

Segno distintivo ottico: color nero-violetto
Ricopertura speciale per lavorare materiali abrasivi (ghisa, AlSi) e/o con elevate sollecitazioni termiche, quindi per impieghi senza raffreddamento o con raffreddamento limitato, come in fori profondi o con diametri piccoli. Bisogna evidenziare che solo con superiori dati di taglio la ricopertura A porta a decisivi miglioramenti di rendimento.

Ricopertura **Super A** o AlTiN (nitruro di alluminio-titanio)
Ricopertura **nanoA** o AlTiN nano (nitruro di alluminio-titanio)

Segno distintivo ottico: color nero-violetto
La sperimentata ricopertura A a base di TiAlN è stata continua-mente sviluppata. Le proprietà strutturali, chimiche e meccaniche ottimizzate della ricopertura Super A portano ad una durezza ad elevata temperatura molto alta, ad un'ottima resistenza all'ossidazione nonchè ad un'eccellente tenuta della ricopertura. Questa ricopertura è adatta per la lavorazione di materiali di difficile truciolabilità, come, ad esempio, leghe di titanio, inconel ed acciai temprati, nonché per la truciolatura di mat. temprati (> 52HRC) e per la lavorazione ad alta velocità.

Ricopertura **C** o TiCN (nitruro di titanio-carbonio)

Segno distintivo ottico: colore grigio-viola
Porta sensibili vantaggi nella lavorazione di acciaio, con tagli interrotti, materiali di difficile truciolabilità o, in generale dove sussistano esigenze superiori alla media relativamente a durezza e plasticità.

Ricopertura **F** o FIRE/nanoFIRE

Segno distintivo ottico: color nero-violetto
Ricopertura multistratificata TiAlN di costituzione gradiente. Ricopertura universale con rendimenti di almeno 2 volte superiore alla TiN. Riunisce i vantaggio di TiN, TiAlN e TiCN. Eccellente isolamento termico, per così dire „a prova di fuoco". Alta plasticità. FIRE + MolyGlide - la combinazione ideale ed il presupposto per lavorazione a secco ed ad alta velocità (HSC).

Ricopertura **T** o TiN (nitruro di titanio)

Segno distintivo ottico: color oro
Ricopertura universale sperimentata milioni di volte a prezzo conveniente. Con essa si possono ottenere in generale alti aumenti di rendimento. Non sono raggiungibili i valori massimi ottenibili con le ricoperture A e C.

Ricopertura **M** o MolyGlide® su base MoS_2

Segno distintivo ottico: color verde oliva
Ricopertura tenera di scorrimento, brevettata, sviluppata specificatamente per migliorare lo scorrimento ed eliminare i taglienti di riporto nella lavorazione di leghe di alu. In combinazione con la ricopertura dura FIRE si possono realizzare la lavorazione a secco ovvero la nebulizzazione.

Superfici

Ricopertura **Y** o **TiAlSiN**

Segno distintivo ottico: color rosso bronzo
Ricopertura multistratificata molto dura e resistente al calore adatta particolarmente per la lavorazione di acciai molto duri e ghise.

Ricopertura **AlTiZeN**

colore rivestimento: oro chiaro
Particolarmente adatto per la lavorazione di acciaio inossidabile ad alta evacuazione di truciolo, ma anche per le leghe a base di nichel.

Ricopertura **TiSiN**

colore rivestimento: rosso rame
Nanocompositi altamente resistenti al calore per la lavorazione di acciai al carbonio, acciai automatici e acciai con contenuto di manganese. Riduce l'usura adesiva. Inoltre, è molto adatto per la lavorazione di acciai altamente resistenti al calore. Per foratura e fresatura limitato a utensili in metallo duro.

Ricopertura **ZrN**

colore rivestimento: oro chiaro
Questo rivestimento multistrato è specificamente progettato per la lavorazione di titanio, leghe morbide a base di nichel, leghe di alluminio più solide e leghe di alluminio colate fino ad un contenuto del 12% di silicio. Minimizza il verificarsi di accumulo di trucioli sui bordi di taglio e massimizza una buona evacuazione degli stessi.

Ricopertura **DLC**

caratteristica ottica: colore nero
Questo rivestimento di carbonio altamente resistente (DLC-diamante-come-carbonio) riduce il verificarsi di accumulo di truciolo sui taglienti durante la lavorazione di leghe di alluminio battuto adesivo / leghe di alluminio e quindi consente un preciso controllo dimensionale e buona superficie sul pezzo.

Ricopertura **Diamante**

colore rivestimento: grigio-nero
Strato di diamante duro per la lavorazione di grafite, fibra di plastica rinforzata e leghe di alluminio da fonderia con più del 12% il contenuto di silicio. Estremamente elevata resistenza all'usura e minimo accumulo sui taglienti di truciolo.

Ricopertura **TiAlZrN**

colore rivestimento: oro chiaro
Evoluzione del FIRE. lavorazione di acciai generici. Il suo principale campo di applicazione è ovunque l'idoneità del FIRE- è limitata a causa di problemi di evacuazione del truciolo.

Tolleranza dei diametri di fori di filettatura nei maschi a rullare (a DIN 13, parte 50)

Per ragioni di resistenza, non è necessario mantenere la tolleranza 6H per i fori di filettatura; la tolleranza 7H è sufficiente a garantire che non sia superato il ricoprimento del diametro medio di 0,32 x P tra madrevite e bullone. Inoltre, la filettatura a rullare, per la corsa della fase non interrotta e la deformazione a freddo, conferisce di regola una resistenza superiore a quella della filettatura normale.

Tolleranze dei diametri

Scostamenti ISO

Nelle punte elicoidali secondo DIN 1414 la normale precisione di fabbricazione corrisponde al campo di tolleranza h8 delle norme ISO. Per le tolleranze più restrittive contemplate dai campi di tolleranza h7, h6 e h5.

Tolleranze delle micropunte secondo DIN 1899

Nelle micropunte fino al Ø 1,5 mm la precisione di fabbricazione corrisponde alle tolleranze previste da DIN 1899.

Tolleranza nel diametro al vertice	= 0/– 0,004 mm
Tolleranza nel diametro al codolo h8	= 0/– 0,014 mm

Tolleranze delle misure non previste dalle norme secondo DIN-ISO 2768

Valori numerici per misure di lunghezza (mm)

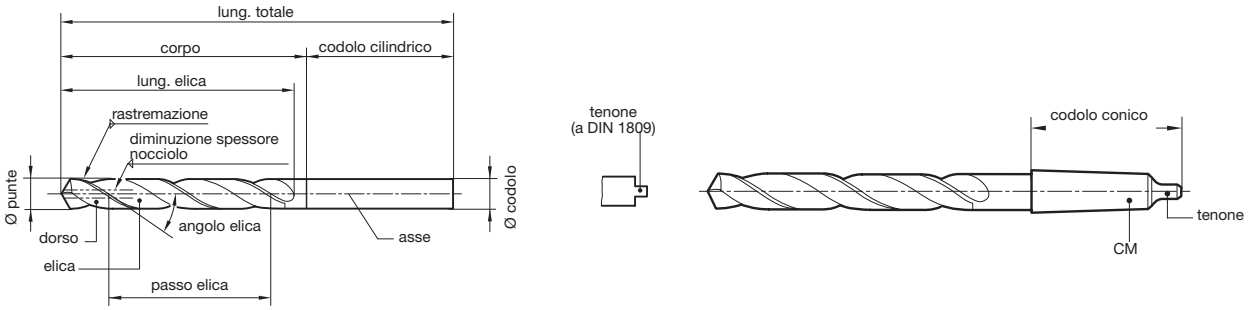
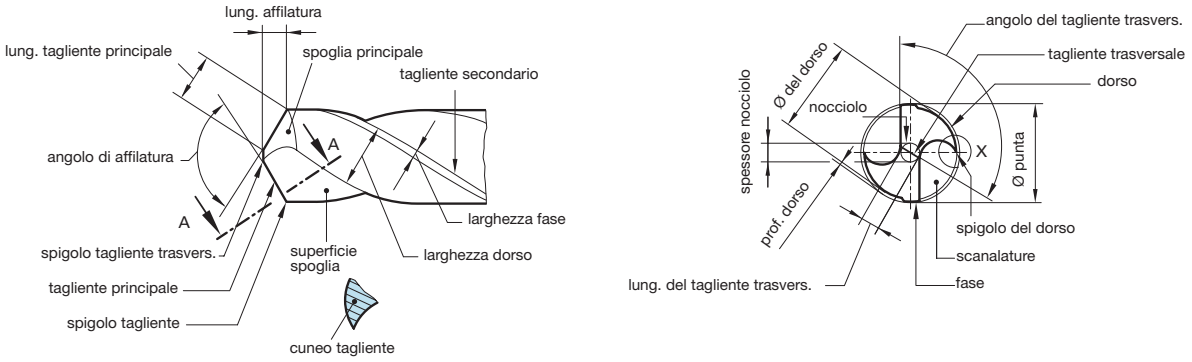
Definizione di punte elicoidali secondo DIN ISO 5419 (Estratto: edizione 06/1998)

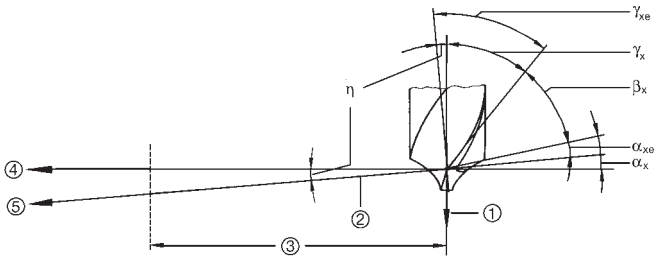
Punte elicoidali con codolo cilindrico/conico Morse



Parte tagliente



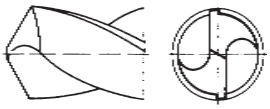
Angoli sui taglienti



α_x	angolo spoglia inferiore (Alpha)	γ_x	angolo spoglia superiore (Gamma)
α_{xe}	angolo spoglia inferiore effettivo	γ_{xe}	angolo spoglia superiore effettivo
β_x	angolo taglio inferiore (Beta)	η	angolo direzione forza taglio (Eta)

Designazione:
1 = direzione avanzamento
2 = avanzamento f
3 = percorso taglio al giro (d · π)
4 = direzione di taglio
5 = direzione forza di taglio
Angolo di spoglia inferiore a, angolo di taglio b ed angolo di spoglia superiore g sono misurati sul piano delimitato dall'angolo. Per i particolari vedere DIN 6581, tecniche di asportazione truciolo: geometria sull'angolo tagliente dell'utensile.

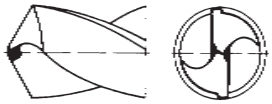
secondo norma di fabbrica



Affilatura normale a mantello

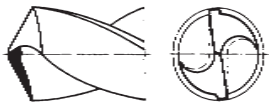
Impiego: per tutte le comuni operazioni di foratura su acciaio, materiali non ferrosi e materiali plastici. Gli angoli di vertice tengono conto del differente grado di truciolabilità dei materiali.
Vantaggi: Robustezza dei taglienti principali, praticamente insensibili all'urto ed alle forze laterali. Affilatura semplice, facilmente eseguibile anche a mano.
Svantaggi: il tagliente trasversale, essendo piuttosto largo, richiede una notevole forza di avanzamento.

secondo DIN 1412 (Estratto, Edizione 03/01)



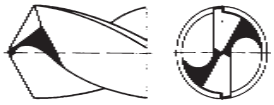
Tagliente trasversale ridotto secondo DIN 1412 A

Impiego: per tutte le comuni operazioni di foratura mediante punte con nocciolo robusto e, nei diametri grossi, per le foratura nel pieno.
Vantaggi: preciso centraggio in sede di foratura grazie all'accorciamento della lunghezza del tagliente trasversale fino ad un decimo del Ø della punta e sforzo ridotto per l'avanzamento.
Svantaggi: affilatura supplementare.



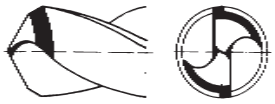
Tagliente trasversale ridotto con correzione tagliente principale secondo DIN 1412 B

Impiego: per la foratura di acciai ad alta resistenza, di acciai a forte contenuto di manganese (oltre il 10% di Mn) e di acciai per molle nonché per allargature.
Vantaggi: insensibile agli urti, ai carichi unidirezionali ed agli effetti delle forze lat.. Nessun rischio di agganciamento nei mat. sottili.
Svantaggi: richiede notevole forza di avanzamento e tende a corsa scentrata, riaffilatura più dispendiosa.



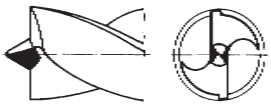
Affilatura a croce secondo DIN 1412 C

Impiego: nelle punte con nocciolo molto robusto per materiali particolarmente tenaci e duri nonchè nelle punte per fori profondi.
Vantaggi: ottimo centraggio, facile avanzamento. Il rompitruciolo assicura asportazione molto efficiente.
Svantaggi: una perfetta riaffilatura è ottenibile solo su macchina.



Affilatura per ghisa grigia secondo DIN 1412 D

Impiego: per la foratura di ghisa, ghisa malleabile e di pezzi fucinati.
Vantaggi: i taglienti principali essendo prolungati prevengono l'usura degli spigoli; insensibilità agli urti e buona dissipazione del calore a tutto vantaggio della durata utile dell'utensile.
Svantaggi: riaffilatura più dispendiosa.



Affilatura con centrino secondo DIN 1412 E

Impiego: per la foratura delle lamiere e dei materiali teneri in genere, per fori ciechi a fondo piano.
Vantaggi: ottimo centraggio, formazione di bava insignificante, forature precise nelle lamiere e nei tubi a parete sottile, senza rischio di agganciamento.
Svantaggi: sensibile agli urti ed ai carichi unidirezionali. Una perfetta riaffilatura è ottenibile solo a macchina.

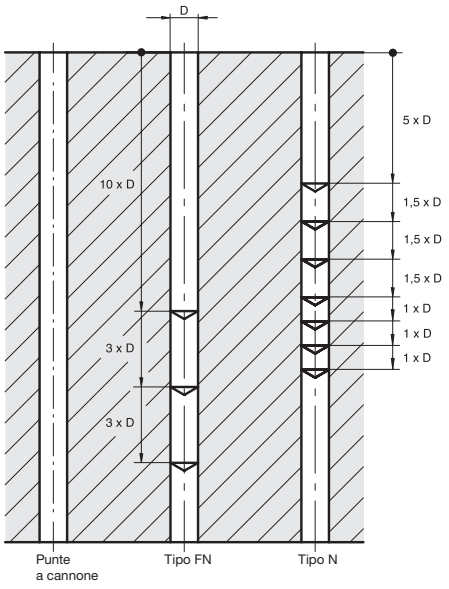
Indice di frequenza di scarico trucioli

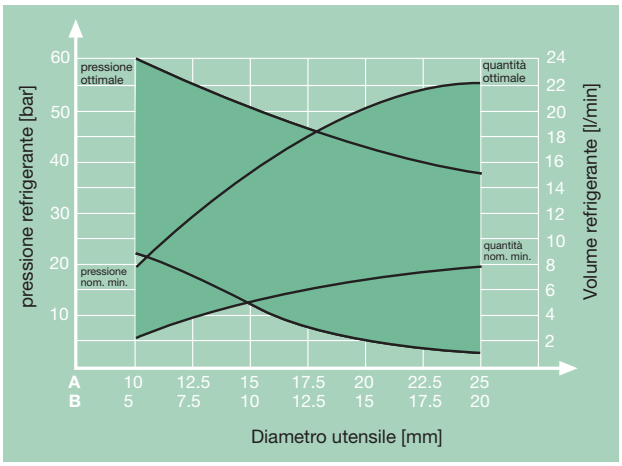
I dati sopra esposti rappresentano valori medi orientativi. Nelle perforazione in profondità si ponga la massima attenzione ad una abbondante e costante presenza di refrigerante ai taglienti della punta. Con lo scarico dei trucioli, da eseguirsi almeno una volta, o meglio ripetute volte, nel corso della lavorazione, la punta si raffredda già in maniera sufficiente. La frequenza delle operazioni di scarico dei trucioli dipende essenzialmente dal tipo di materiale, dalla profondità della foratura nonché dal tipo della punta impiegata.
L'impiego di punte del tipo FN, cioé avente profilo a scanalature piatte riduce sensibilmente la frequenza di scarico. Si tenga presente, comunque che in determinati materiali è possibile influire sul modo di formazione dei trucioli con l'adeguato variare dell'angolo del vertice; se la loro forma è abbastanza favorevole l'asportazione spontanea ne risulterà facilitata e l'afflusso del lubrorefrigerante diventa piu efficace. Per perforazioni di estrema profondità come per le perforazioni
orizzontali si consiglia il ricorso alle punte auto-refrigeranti ad alimentazione interna.

Tutti i dati sono orientativi e rappresentano valori medi.



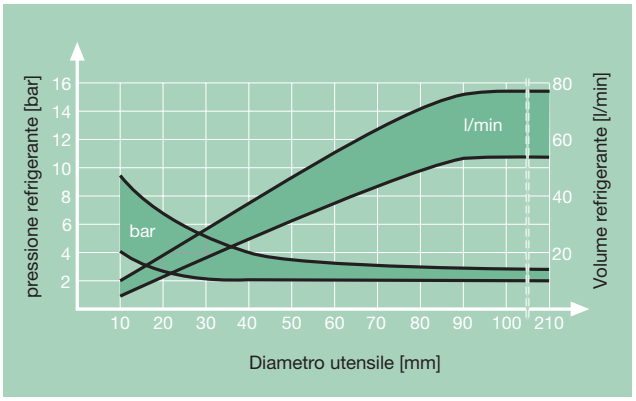
Diagrammi del refrigerante
Pressione e volume del refrigerante

Per punte elicoidali in metallo duro con fori di refrigerazione



A = Diametri per utensili con condotto refrigerante centrale
B = Diametri per utensili con condotto refrigerante elicoidale

Per punte con placchette intercambiabili, sistema Multiplex con fori di refrigerazione



Nella foratura con placchette intercambiabili in HSS-E e MD l'emulsione serve come lubrorefrigerante. Il rapporto di miscelazione è quello usuale di 1:20.

Di decisiva importanza è un efficiente gruppo refrigerante. Una pressione e quantità del refrigerante non sufficienti possono provocare un risultato di foratura insoddisfacente e persino la rottura dell'utensile.

La quantità delle particelle della sostanza solida possibilmente non deve superare i 50 µm.

Consigli per l'impiego di punte elicoidali

I numeri in grassetto della colonna avanzamento indicano gli utensili da preferire.

Refrigerante
Prezzi/misure pag.

Procedimento:
- Fresatura di una superficie perpendicolare rispetto all'angolo di entrata della foratura (necessario soltanto per superfici oblique).
- Eseguire un foro pilota cilindrico (tolleranza F9) con profondi tà minimo 1 x D.
- Entrata nel foro pilota con ca. 300 giri/min. e f = 500 mm/min
- Regolazione di pressione del refrigerante e del numero di giri.
- Foratura continua sull'intera lunghezza senza scaricare.
- Con fori passanti e uscita obliqua ridurre l'avanzamento vf del 40% a ca. 1 mm. prima dell'uscita della punta.
- Spegnimento dell'adduzione refrigerante al raggiungimento della profondità di foro voluta, corsa di ritorno rapida.

I numeri in grassetto della colonna avanzamento indicano gli utensili da preferire.

HARTNER

Consigli per l'impiego di punte a cannone

Come lavorare con punte a cannone

- Produzione del foro pilota (L = 1,5 x D, tolleranza H8)
- Entrata con nr. giri limitato, ca. 200 giri/min, avanzamento ca. 500 mm/min.
- Regolazione di pressione del refrigerante e del numero di giri
- Foratura in continuo sull'intera lunghezza, senza scaricare. Impiegando punte a cannone con un grosso rapporto lunghezza-diametro, consigliamo di lavorare fino ad una profondità di foro di ca. 25 mm con parametri di taglio ridotti (ca. 75% della velocità di taglio ottimale).
- Spegnimento dell'adduzione refrigerante al raggiungimento della profondità di foro voluta
- Corsa di ritorno rapido con mandrino fermo.

HARTNER

Suggerimenti e trucchi
- Con profondità di foro superiore a 40 x D, consigliamo l'impiego di due o più punte a cannone, p. es. Ø 10 x 400 mm e Ø 9,95 x 800 mm.
- Punte a cannone per profondità di foro superiore a 40 x D dovrebbero essere guidate nel foro pilota con rotazione sinistrorsa.
- Nel cambio di utensili da 40 x D, gli stessi possono essere smorzati con l'accensione di refrigerazione interna ad alta pressione per ca. 1 secondo.
- Per la lavorazione di materiali a truciolo lungo, consigliamo di ordinare punte a cannone con scanalature lucidate.
- In generale consigliamo di impiegare emulsione con almeno il 10% di grasso.
- Punte a cannone ad un tagliente per alluminio a truciolo lungo dovrebbero essere ordinate con angolo di affilatura a 180° e spazio per vano olio.
- Nell'entrare in alluminio con meno dell'1% di Si, cioè con velocità di taglio consigliate vc > 160 m/min, consigliamo di raggiungere il numero di giri finale in più passaggi. Inoltre si dovrebbe avere un foro pilota di ca. 3 x D.

STOP

Tutte le punte a cannone devono essere guidate da un foro pilota. Le punte a cannone non devono essere mai mosse libere al massimo dei giri nello spazio macchina.

Refrigerante:
○ Aria
● Olio
● Emulsione

Tutti i valori sono indicativi. La velocità di taglio e l'avanzamento effettivamente realizzabili dipendono dalle reali condizioni di lavoro. Consigliamo di effettuare prove di foratura.

- Per la realizzazione di fori passanti bisogna controllare che le fasi di guida restino in presa. Inoltre l'avanzamento va ridotto prima di effettuare il foro passante.
- In generale, per profondità di foro da 5xD, consigliamo l'uso dello stelo art. 86681 e relativo inserto art. 86721, per effettuare il foro pilota consentendo il centraggio ottimale.
- Senza foro pilota, consigliamo di ridurre l'avanzamento durante centratura.
- Non utilizzare la punta per fori interrotti (scanalature, fori trasversali) senza prove preliminari. In caso di fori interrotti (max. 0,2 x D) consigliamo, se possibile, di ridurre l'avanzamento.
- Contrariamente alle classiche punte ad inserto, la Multiplex è adatta anche per la foratura di pacchi di lamierini.
- Su torni (utensile fisso) fare attenzione che l'utensile sia esattamente nel centro
- Presupposto per una truciolatura ottimale è una buona refrigerazione con emulsione ad olio.
- L'utensile è adatto per lavorazione a secco o con nebulizzazione solo a ben determinate condizioni. Con nebulizzazione suggeriamo l'impiego di codoli conici per nebulizzazione, nonché di mandrini per nebulizzazione. Chiedete ai nostri tecnici che Vi consiglieranno.
